§1 Day 1: Introduction to Class (Sep. 3, 2024)

Class administration notes;

- Prof. Ila (she prefers to be called Ila) will be in Montreal once in a while.
- Masks should be worn if attending lectures in person.
- All reference material for the class can be found on here, or in the UofT library.
- This class will be held in a more experimental teaching style; specifically with the Tuesday discussions.
- Prof. Ila prefers to be contacted on Zulip instead of mail.

To start, this class is on arithmetic statistics, which studies "arithmetic objects." Examples of such objects interesting from a number theory perspective include

- Fields, specifically finite extensions of \mathbb{Q} (number fields),
- Binary quadratic forms, i.e. $f(x,y) = ax^2 + bxy + cy^2$,
- \bullet Varieties over \mathbb{Z} , i.e. zero sets of polynomials with integer coefficients,
- Ideal class groups,
- Primes.

Composition laws can be described as equipping a set with group operations; for example, let us consider the $SL_2(\mathbb{Z})$ -equivalence classes of binary quadratic forms; given $\gamma \in SL_2(\mathbb{Z})$, we have $\gamma f(x,y) = f((x,y)\gamma)$.

Exercise 1.1. If $\gamma \in \operatorname{SL}_2(\mathbb{Z})$, prove that $\operatorname{disc}(f(x,y)) = \operatorname{disc}(\gamma \cdot f(x,y))$. Specifically, the discriminant of $\operatorname{disc}(ax^2 + bxy + cy^2) = b^2 - 4ac$.

Exercise 1.2. Any polynomial Δ in a,b,c satisfying $\Delta(f(x,y)) = \Delta(\gamma \cdot f(x,y))$ is a multiple of the discriminant, or is constant.
